Let's Start!

This is the way the world communicates!

Learning Outcome:

Describe common activities at work to a visitor using short sentences in familiar spoken and written situations.
Understand information about data and its structure in simple spoken and written situations.

Can Do Statements:

- I can talk about data communications.
- I can talk about specific features related to data communications.
- I can explain briefly how data communications work.

Ask your partner:

- What are the most effective ways to communicate?
- Do you think current technologies are beneficial to communication? Why?

Let's Explore!

Dylan and Kate check what they know about data communications.

Instructions: Read the text below.

- Dylan:** Sure! I know that data communications refer to the transfer of information between computers and users as well.
- Kate:** Yes. At the most abstract level, to make communication possible, data communications need two or more computers, a device to turn information into electronic signals, and a transmission medium.
- Dylan:** Don't forget it also needs a software that manages the flow of information. What are the devices that transform information?
- Kate:** Well, I'm checking that part. They're called modems. This communication can happen in different ways, from telephones to wireless connections. I'm just trying to understand how data communications works.
- Dylan:** When the computers are not connected, the data travels through a network (local or global). Because networks are wide, the data needs to travel with address and the place where it fits.
- Kate:** Is it necessary to divide the information before the computer sends it?
- Dylan:** Yes. It makes the process easier. Is there anything else we can use for the test?
- Kate:** Of course! More specific features describe the serial transmission. It's when data transfer occurs one bit at a time. Different to multiplexed when it's possible to carry many channels with more bits at the same time.
- Dylan:** Ok. I read that today, many different ways of transfer are working in different devices. For example, a single device can transfer data in different ways. Technology nowadays requires devices to be very flexible.

Let's Practice!

Characteristics Related to Data Communications

Instructions: Select the correct answer.

1. Multiplexed transmission sends...
Hint: refers to a countable and an uncountable noun.
 - a. much information to many channel with many bits at the same time
 - b. much information to many channels at the same time.
 - c. many informations to much channels at the same time
2. Data communication needs ...
Hint: refers to an uncountable noun.
 - a. three softwares to manage the flow of information.
 - b. a software to control the flow of information.
 - c. softwares to administer the flow of information.
3. When computers are not physically connected...
Hint: refers to a countable noun.
 - a. the data travels through a network
 - b. datas travel through computers.
 - c. informations are shared over the air.
4. To make communication possible, it is necessary...
Hint: refers to a specific amount of countable nouns.
 - a. to have much computers
 - b. to have a computer.
 - c. to use two or more computers.

Let's Practice!

In short, data communications work like this!

Instructions: Select the best options in the table. There is only one answer per sentence

**Let's Practice!**

	Basic Elements of Data Communications	How to send the information	Serial and Multiplexed Transmission
When data transfer occurs one bit at a time, it refers to serial transmission. Different to multiplexed because it's possible to carry many channels with more bits at the same time.			
Data communications require at least two computers, a device to turn information into electronic signals, and a transmission medium.			
To make the process easier, it's necessary to divide the information before the computer sends it.			

Extension Activity

Data Communication in Other Fields

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Read information about Data Communication.
- Select a specific scenario where data communication works.
- Describe how data communications work using action verbs.
- Write a short paragraph with the information above and include new briefly explanations about data communications.
- Read your paragraph aloud.

Self-Assessment

Yes

No

- I recognize the characteristics of data communications in other fields.
- I describe the new aspects and concepts about data communication.
- I explain how data communications work.

☐ ☐
☐ ☐
☐ ☐

Target Words

- **transfer** (verb): to move from one place to another
e.g. I know that data communications refers to the transfer of information between computers and users as well.
- **medium** (noun): a channel or object used to carry or achieve something
e.g. ... data communications needs two or more computers, a device to turn information into electronic signals, and a transmission medium.
- **flow** (noun): movement or stream
e.g. Don't forget it also needs a software that manages the flow of information.
- **wireless** (adjective): that doesn't need cables or wires
e.g. This communication can happen in different ways, from telephones to wireless connections.
- **through** (preposition): that goes across something
e.g. When the computers are not connected, the data travels through a network (local or global).
- **wide** (adjective): big in size from side to side
e.g. Because networks are wide, the data needs to travel with address and the place where it fits.

Learning Points

Action Verbs to Talk About Data Communications in Different Tenses

Action verbs represent actions we put into practice every day.

There are different verbs we can use to talk about data communications to describe different processes.

Verbs like **transfer**, **require**, **manage**, **connect**, and **send** have different meanings according to the context in which we use them. However, when talking about data communications, these verbs acquire a more specific meaning to describe processes.

Examples

- *I know that data communications refers to the transfer of information between computers and users as well.*
- *Don't forget it also needs a software that manages the flow of information.*
- *Is it necessary to divide the information before the computer sends it?*

Countable and Uncountable Nouns to Talk About Communications

Nouns in english can be countable and uncountable, they have the characteristic to adopt singular or plural forms.

Countable nouns refer to something we can count with numbers. They can have both singular or plural forms.

For example:

A computer - Two computers.

Uncountable nouns are the opposite, they refer to the ones that cannot be counted by numbers in plural form. That's why uncountable nouns are always singular.

Some examples of countable nouns in communications are: **computer**, **device**, **signals**, or **user**. Those nouns have plural form and you can count them with numbers.

Some examples of uncountable nouns in communications are: **communication** or **software**, are nouns that can't be counted with numbers. They describe generalities that usually are not quantifiable.

Examples

- *At the most abstract level, to make communication possible, data communication needs two or more computers, a device to turn information into electronic signals, and a transmission medium.*
- *When the computers are not connected, the data travels through a network (local or global).*

Learning Points

What does ICT mean?

It stands for **Information and Communications Technologies**.

ICT refers to any kind of communication device or application. They have different uses in different contexts such as education, health care, entertainment, etc.

Because of the widespread and exponential evolution of technology, organizations worldwide are making great efforts to close the gap between countries that have access to technologies and those that don't.
